

Supplementary Fig. 1. Erythroid gene expression in reticulocytes of study participants with TDT, NTDT. Erythroid gene expression (A) *GATA1* and (B) *KLF1* in reticulocytes of study participants with TDT, NTDT, and healthy controls quantified using real-time PCR. The expression level was normalized to β -actin. *GATA1* (N=15,15,15), and *KLF1* (N=15,15,15) (number of study participants with TDT, NTDT samples, controls, respectively) are shown.
